

SD Field Concat 2.0

Concatenate any amount of fields into one value. Ideal for creating unique titles etc. Value can now be rendered as well.

YOU CAN USE THE FOLLOWING VARIABLE / PLACE HOLDERS IN YOUR FIELD LIST:

- **#field_name#** - Gets the value of another field
- **\$date** - Current date in YYYY-MM-DD format unless other date format specified in the settings window
- **\$time** - Time in HH:MM:SS format
- **\$username** - Logged in users username
- **\$userid** - Logged in users ID
- To add plain text, wrap your text in square brackets like this: [This is plain text]

EXAMPLE USAGE

```
[Comment by user]||$userid||[on]||$date
```

Will result in the value **'Comment by user 42 on 2011-08-24'**

- All fields (both plain text, palce holders and fields) MUST be separated with a double pipe **||**.
- You can choose how you want to bind these values together using the Value Separator field. If you leave it blank it will default to a space.
- If Use Jtext is set to 'yes' then all your plain text values will be converted to language strings prefixed by **PLG_CCK_FIELD_SD_CONCAT_** followed by an upper case value of your string, with **_** replacing all space elements. So if you entered Joe Soap as a plain text value, it's language string would be **PLG_CCK_FIELD_SD_CONCAT_JOE_SOAP**
- Please try avoid using any special characters here.
- Jtext key value pairs are stored in your language overrides folder in administrator

Using the same above examples value, we would use the following Jtext string to have the value translated on the fly: **PLG_CCK_FIELD_SD_CONCAT_COMMENT_BY_USER**
